ACTIVITY-BASED LEARNING REPORT

Three Responsive Website Designs Using HTML and CSS

Student Name	CH. DURGA PRASAD SESHADRI
Roll Number	26000016
Department / Section	CSE – Section 1
Technology Used	HTML5 and CSS3 (No JavaScript)

Submitted as a practical web development activity. The report documents the purpose, design, features, implementation approach and visible browser output of three small website projects.

Project set: Personal Portfolio • Northstar College • Crumb & Co. Bakery

1. Introduction

This activity demonstrates how static websites can be designed using semantic HTML and CSS without JavaScript. Each website uses a different visual style and content structure to practice layout, navigation, responsive design, typography, colour selection and reusable CSS patterns.

2. Objectives

• Build three attractive and professional multi-section website pages.

• Use HTML elements to organise content and CSS to control presentation.

• Create navigation links that move to sections within each page.

• Apply responsive layouts for smaller screens using CSS media queries.

• Use hover effects, cards, buttons, colour palettes and images to improve usability.

• Keep the implementation JavaScript-free, as required.

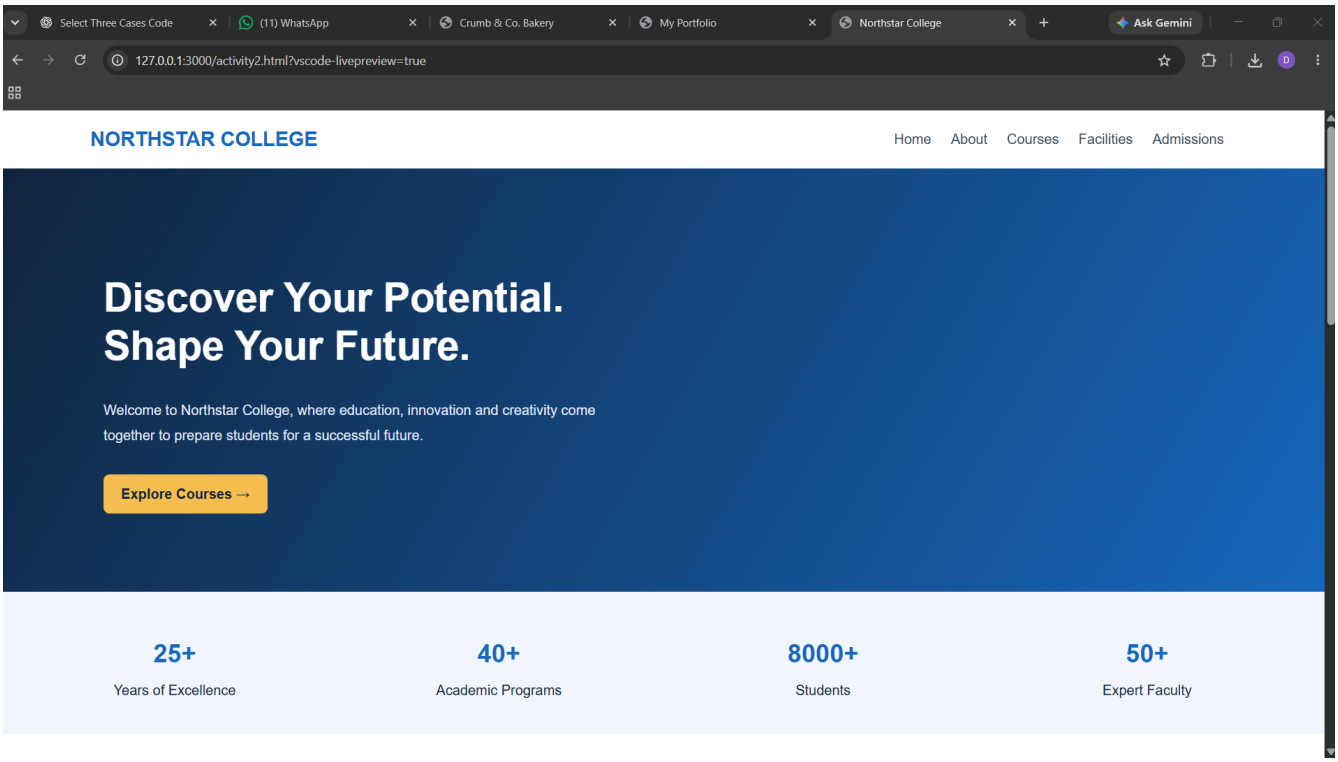

3. Tools and Technologies

HTML5: page structure, headings, sections, links, images and content. **CSS3:** colours, spacing, flexbox, grid, responsive media queries, borders, hover effects and typography. **Editor / browser:** Visual Studio Code Live Preview and Google Chrome were used to view the pages, as shown in the supplied screenshots.

4. Project Summary

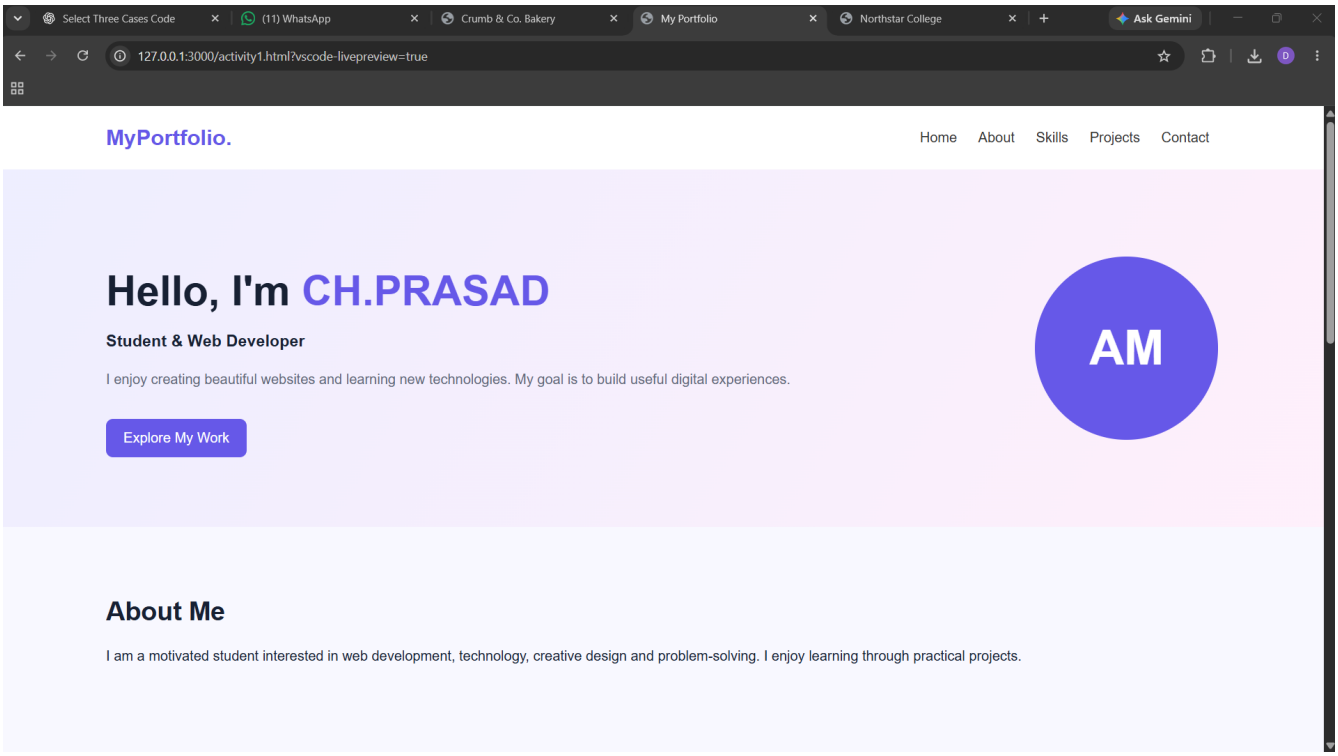

Website	Design focus	Main sections
Personal Portfolio	Purple and light pastel palette	Home, About, Skills, Projects, Education, Contact
Northstar College	Navy blue, blue and gold	Home, About, Courses, Facilities, Admissions
Crumb & Co. Bakery	Cream, peach and chocolate brown	Home, Menu, Story, Contact

Screenshot 1 — Northstar College Website

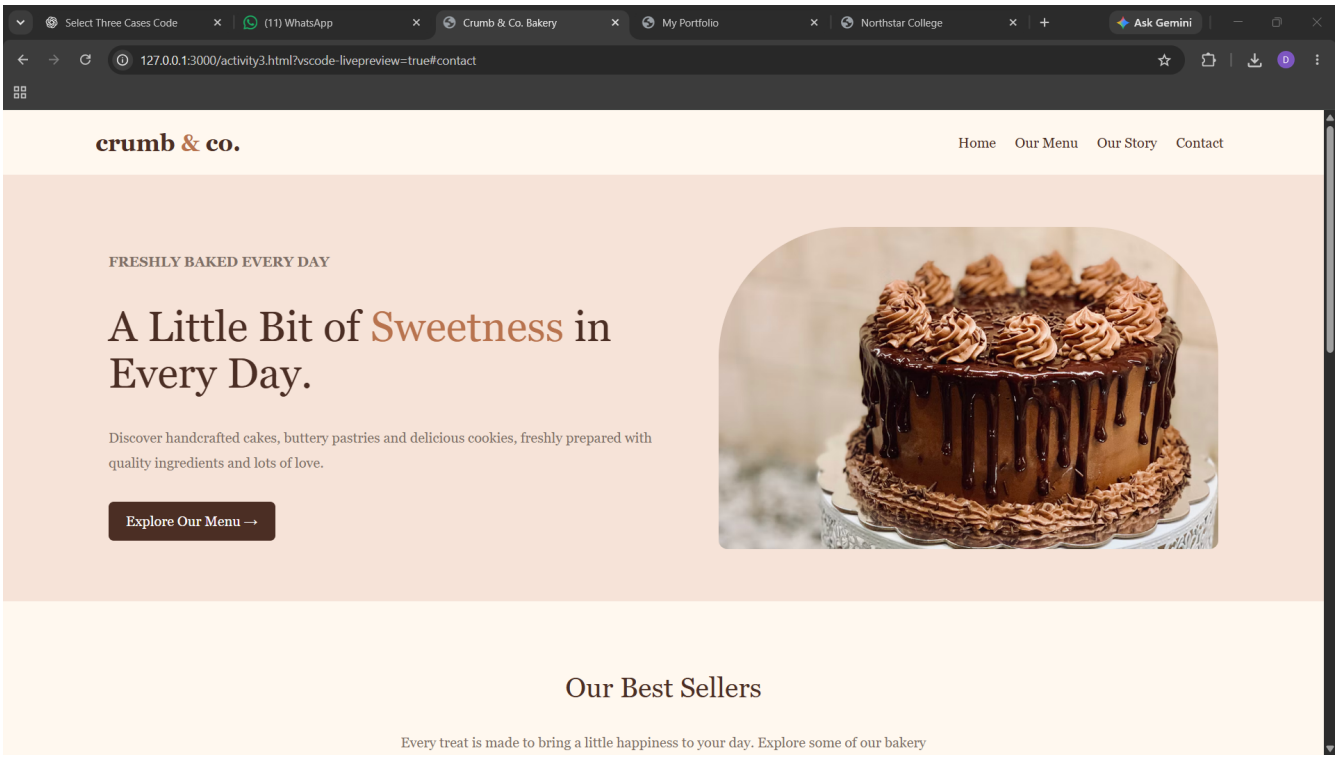

The college website uses a white navigation bar, a navy-to-blue hero background and a gold call-to-action button. A statistics row presents college highlights. The design uses a clear hierarchy and high-contrast text.

Screenshot 2 — Personal Portfolio Website

The portfolio page uses a purple accent colour, a pastel hero section and a simple profile monogram. The navigation links connect to the About, Skills, Projects and Contact sections.

Screenshot 3 — Crumb & Co. Bakery Website

The bakery page uses warm cream and peach backgrounds, chocolate-brown text and a large cake photograph. Serif typography supports the bakery theme, while the menu section introduces product cards.

5. Implementation Details

Each project stores its styling inside a <style> element in the HTML document. Flexbox is used for header and hero alignment where appropriate, while CSS Grid lays out statistics, courses and product cards. The @media rule changes the layout for screens up to 700 pixels wide, making the cards stack vertically and improving navigation readability.

6. Testing and Observations

• Opened each HTML page in the browser and checked the visible first-screen layout.

• Confirmed that the navigation is implemented with ordinary anchor links to page section IDs.

• Checked that CSS hover effects are defined for links or cards where included.

• Responsive styles are included for smaller screens; the pages should also be checked at mobile widths before final submission.

• The pages do not include JavaScript. Remote images require an internet connection.

7. Limitations

These are static front-end demonstrations. Contact links open an email application, but there is no database, login system, application form submission backend, shopping cart or real-time data. Some text, contact details, college statistics and prices are sample content and should be edited if the projects are used beyond demonstration.

8. Conclusion

The activity provided practical experience in structuring web pages with HTML and styling them with CSS. The three projects demonstrate different visual identities while using the same core skills: semantic sections, navigation, responsive grids, typography, colour contrast and hover states. The objective of creating three professional-looking websites without JavaScript was achieved in the supplied implementation.
